ACKNOWLEDGEMENT

The 2017 Estimates and Projections were generated and produced by the Ghana's National Estimates Team comprising individuals from selected institutions. Technical and financial support was provided by Ghana AIDS Commission (GAC), Centres for Disease Control and Prevention (CDC), National AIDS/STI Control Programme (NACP) of the Ghana Health Service, and UNAIDS Geneva and Ghana, the UN Reference Group on Estimates, especially the HIV Estimates Coordinator, Mary Mahys.

The tools for generating the estimates and projections, Estimation and Projection Package (EPP) and SPECTRUM, were developed by UNAIDS and the Futures Institute. Special thanks go to all the institutions which have been at the forefront in providing the basic data (2003, 2008 and 2014 Ghana Demographic and Health Survey (GDHS), Ghana Statistical Service (GSS) Projected Population, HIV Sentinel Survey (HSS) and Ghana Health Service (GHS) and NACP HIV programme data) which were used to generate the estimates.

The outputs of the estimation process were validated by the Research, Monitoring and Evaluation (RM & E) subcommittee of the Ghana AIDS Commission. Their wealth of knowledge and experience ensured the production of an estimates report that responds to national needs and measure up to global standards.

We further appreciate the effort of the National Estimates Team: Mr. Isaiah Doe Kwao, Mr. Ekow Wiah, Mr. Silas Quaye, Mr. Godwin Odei Gyebi, Dr. Anthony Ofosu and Dr. Henry Nagai who collated, generated and produced, reviewed and finalized the draft report, incorporating relevant contributions from stakeholders to the content and substance of the report at various stages of its development.

1.0 INTRODUCTION

HIV prevalence data is critical for planning and implementing programs in the National Response. The data is useful for understanding the magnitude of HIV and AIDS problems and for monitoring the impact of interventions. Generation of HIV prevalence data is done using UNAIDS/WHO recommended methods. As in other countries with generalized HIV epidemics, the estimates of HIV prevalence in Ghana is primarily based on sentinel surveillance among pregnant women attending antenatal care (ANC) clinic and a national population-based survey which includes HIV testing. Additional program data on the number of men, women and children on ART, the number of women receiving ARVs as prophylaxis (PMTCT) and other demographic and epidemiological information to determine the impact of HIV is fed into the software.

It is acknowledged that both sentinel surveillance and population-based surveys each have strengths and weaknesses but together provide complementary information. HSS provides samples that are consistent over time so that good estimates of HIV trends can be obtained. Population-based surveys, on the other hand, provide a better geographic coverage of the general population, and analysis of combined data from the sentinel surveillance provides a clear picture of overall trends and geographical distribution of HIV. HIV and AIDS data from all other available sources, including ART and routine PMTCT data were compiled and used as inputs for the projection to supplement the HSS and Survey data.

This technical report provides the Ghana National HIV Prevalence Estimates and Projections for 2013 to 2022 and describes the approach that was used to produce them. It is important to note that estimates and projections captured in this report take precedence over previous ones.

2.0 BACKGROUND OF ESTIMATION AND PROJECTION

UNAIDS and WHO, with the guidance and recommendations from an external group of scientists and researchers (the UNAIDS Reference Group on Estimates, Modelling and Projections), have developed a set of methods and assumptions to model epidemic trends, to determine annual estimates of HIV prevalence in countries, and to make demographic projections of the epidemic. For countries with generalized epidemics in which HIV is firmly established in the general population, the Estimation and Projection Package (EPP) has been designed as a tool to construct national and sub-national (e.g. urban and rural/regional and district) epidemic curves to indicate the levels and trends of the epidemic.

Once epidemic curves are produced in EPP, which is already in-built in the SPECTRUM Projection Package, estimates of national prevalence, incidence, mortality and treatment needs by sex and age groups are generated. The SPECTRUM module for HIV and AIDS projections uses the HIV epidemic curve produced in EPP together with assumptions about the epidemiology of HIV (including the ratio of female to male prevalence, distribution of infection by age, the survival distribution and the effect of HIV on fertility) to calculate HIV prevalence, incidence and mortality by age and sex. SPECTRUM also calculates the number of child infections occurring through mother to child transmission, child deaths, and the number of AIDS orphans, as well as the estimates of persons needing treatment. The UNAIDS Reference Group on Estimates, Modelling and Projections continues to improve the assumptions and EPP software to ensure better estimates and projections. The 2017 data was generated using the SPECTRUM version 5.65.

Countries require HIV estimates for sub-national geographic areas to plan and monitor their HIV epidemic and response with more precision than would be possible with only national estimates. The sub-national estimates complement efforts led by UNAIDS which use data from Demographic and Health Surveys to estimate HIV prevalence at the Regional and District levels. The sub-national estimates thus provide more variables to support sub-national program managers to plan and monitor the epidemic.

It has been observed that there are geographic variations in HIV incidence and prevalence as well as program implementation in Ghana. Surveillance data and HIV estimates, available by national, regional and district disaggregations, provide inputs for the generation of subnational estimates. These estimates provide the granular strategic information required to improve geographic planning and target setting in national HIV strategic plans.

3.0 ESTIMATION PROCESS AND METHOD

3.1 National Estimates

The sources of data for the National Estimates and Projections 2017 – 2022 was from the HIV Sentinel Survey (1992 to 2017), the 2003, 2008 and 2014 GDHS, Antiretroviral Therapy and Prevention of Mother to Child Transmission program data as at December 2017.

3.1.1 Ghana Demographic and Health Survey Data Used to Calibrate the National Epidemic Curve

The 2003 and 2014 GDHS (which included data on HIV testing, HIV prevalence for urban and rural localities as well as their sample size and standard errors) were used in building assumptions in addition to the HSS data to generate the curve.

3.1.2 Sentinel Surveillance Data Entered in EPP

Ghana has over the past 25 years been conducting annual HSS to provide the trend of HIV. In the last ten (10) years, the HSS data have also been used as the primary data source for the National HIV and AIDS estimates in Ghana. There are 40 sentinel sites with at least three sites from each region made up of 23 urban and 17 rural sites. The current rural/urban proportion of sites ensures a balanced representation in the determination of the HIV prevalence in Ghana. The number of sites has remained the same since 2005. HIV prevalence among antenatal clients for 2017 2.1%. HIV prevalence in urban areas is higher (2.5%) than rural (1.0%). The HSS urban and rural sites data from 1992 to 2017 were entered into EPP to generate the epidemic curve.

3.1.3 Program Data

Program data on the number of men, women and children on ART, the number of women receiving ARVs for prophylaxis (PMTCT) was fed into the software.

3.1.4 Other Data Applied

- a) Estimates of the population by age and sex projected over time were generated by using data from the UN Population Division.
- b) Survival on ART for Children:
 - Under 1 year old - 85%
 - Age 1 year and Older
 - 1st year survival - 85% and survival in subsequent years - 93%.
- c) Ratio of fertility of HIV infected women to the fertility of uninfected women (15-49) is 95%.
- d) From 2017 onwards, the ARV Eligibility criteria at <350 was removed and the treat all policy applied.
 - Net migration patterns
 - Life Expectancy
 - Breast Feeding

3.1.5 Generating the Epidemic Curve

The R-Spline model was used for generating the curves. This is the best model for countries with more than 8 years of surveillance data and over 7 surveillance sites.

Using the sentinel surveillance and GDHS data, the EPP software generates several probable curves first and then selects a sample of “the best fit curves” out of the total number initially generated through a process referred to as uncertainty analysis. The final epidemic curve is the median of the resampled curves.

The specific conditions for each parameter are displayed in tables 1 and 2 respectively. Based on the parameters and prevalence data from HSS calibrated with DHS+ data, the best fit curve for the Ghana HIV epidemic was generated for both urban and rural locations. See Figures 1 and 2 below.

Table 1: EPP Curve Fitting Urban Parameters

Figure 3: Population Living with HIV in Total (Urban and Rural Areas)

3.1.6 Estimating the Size and Demographic Impact of HIV in Spectrum

Estimating the size of HIV and AIDS population and the demographic impact was based on the curve generated in EPP, estimates of the population, epidemiological assumptions and service provision program data. The Spectrum program calculates the number of adults and children living with HIV, AIDS deaths, new infections, and treatment needs and coverage. Tables 3 and 4 show demographic and Program data used in estimating the size and impact of HIV and AIDS. The default values in the Spectrum software which are estimates from the UN Population Division 2012 Population Prospects was used. Below is a summary of the values.

Table 3: Population and Demographic Parameters Used for Projection

Parameter	...	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	...
Life Expectancy												
Male		62.4	62.6	62.7	63.0	63.0	62.9	62.9	63.1	63.3	63.5

No. of HIV positive Pregnant women receiving single dose Nevirapine	584	1,239	1,448										
No. of HIV positive Pregnant women receiving Combivir			2,896	4,991	3,634	5,845							
No. of HIV positive Pregnant women receiving Triple Prophylaxis from 14 weeks							4,057	4,510	3,712	4,268	3,677		
No. of Adult receiving ART services (cumulative)	3,663	6,736	11,777	20,602	28,647	38,188	56,050	66,366	71,855	79,131	78,323	95,712	119,165

3.2 Sub-national Estimates

The main sources of data were used to generate the sub-National Estimates for 2017:

- i. National HIV Estimates, 2017 (Spectrum)
- ii. National, regional and district projected population for 2017
- iii. 2014 Ghana Demographic and Health Survey HIV prevalence data
- iv. 2017 Routine PMTCT data

Using Excel spread sheet, data from these sources were allocated to various regions and districts as inputs to generate indicators such as HIV prevalence, HIV population, new HIV infections and annual AIDS deaths.

4.0 RESULTS

4.1 National Estimates Results

The estimated adult national HIV prevalence for 2017 is 1.67% (C.I: 1.36% – 2.00%), with the number of people living with HIV and AIDS estimated at 313,063 (approx., 310,000) persons. This is made up of 284,860 (\approx 280,000) adults and 28,203 (\approx 28,000) children living with HIV and AIDS representing 91.0% adults and 9.0% children respectively. The HIV adult incidence rate in 2017 is estimated at 0.68%, and there were 19,101 new infections (82.1% adults, 17.9% children) and 15,694 AIDS deaths. Annual AIDS death amongst children 0-14 years is estimated to be 2,902.

A total number of 3,422 (\approx 3,400) new child infections were estimated to have occurred among children 0-14 years. The 15 – 24 year group accounted for 5,557 (\approx 5,600) of the new infections. The number of AIDS orphans is estimated at 186,187 (\approx 186,000). Total need for Antiretroviral Therapy (ART) by December 31 2017 is estimated to be 312,598 and an estimated number of 18,263 (\approx 18,000) mothers will also need PMTCT services. See table 5.

Table 5: National HIV Prevalence Estimates, 2017

2017	Lower 2.50%	Median 50%	Upper 97.50%
HIV Adults + Children	260,872	313,063	369,604
HIV Population – Adults 15+	237,759	284,860	335,845
HIV Population – Children (0 -14)	20,601	28,203	33,980
HIV prevalence- Adults (15-49)	1.36	1.67	2.00
Number of new HIV infections	14,990	19,101	23,893
New HIV infections- Adults (15+)	12,287	15,678	19,816
New HIV infections- children	1,976	3,422	4,650
HIV incidence- Adults	0.54	0.68	0.86
Total AIDS deaths	12,374	15,694	19,113
Annual AIDS deaths- Adults (15+)	9,918	12,792	15,753
Annual AIDS deaths- Children (0-14)	1,877	2,902	3,698
Annual AIDS deaths- adults (15-24)	465	790	1,280
Annual AIDS deaths:-children (1-4)	822	1,316	1,720
Mothers needing PMTCT	10,578	18,263	24,246
AIDS orphans	157,710	186,059	215,170
HIV population (15-49)	196,870	240,963	289,668
HIV 15+ females	160,653	190,179	224,506
New HIV infections- Males 15-24	172	1,175	1,719
New HIV infections- Females 15-24	2,351	4,382	6,306

4.2 Outlook for 2018

The projected adult national HIV prevalence for 2018 is 1.64% (C.I: 1.35% – 1.98%), with 316,613 number of people living with HIV and AIDS. This is made up of 289,883 adults (15+ years) and 26,730 children (0-14 years) living with HIV and AIDS. The HIV adult incidence rate in 2018 is estimated at 0.62%. It is projected that there will be 17,649 new infections and 11,908 AIDS deaths. Annual AIDS deaths amongst children 0-14 years is projected to be 2,473. See Table 6.

Table 6: National HIV Prevalence Estimates, Outlook for 2018

2018	Lower 2.50%	Median 50%	Upper 97.50%
HIV Adults + Children	265,392	316,613	375,789
HIV population- Children (0-14)	19,636	26,730	32,021
HIV population Adults (15+)	242,986	289,883	341,868
HIV Prevalence- Adults (15-49)	1.35	1.64	1.98
Number of new HIV infections	13,863	17,649	22,083
New HIV infections Adults (15+)	11,708	15,085	19,363
New HIV infections - (Children)	2,011	2,564	3,132
HIV incidence- Adults	0.48	0.62	0.77
Annual AIDS deaths	9,174	11,908	14,759

4.3 Trends and Projections from 2013 – 2022

4.3.1 HIV Prevalence and Incidence

HIV prevalence is projected to drop gradually from 1.85% in 2013 to 1.67% in 2017. It is projected to drop further to 1.51% in 2022. A similar trend is expected within the same period for HIV incidence which is also projected to drop gradually from 0.11% in 2013 to 0.05% in 2022. See Figures 4 and 5.

Figure 4: Adult HIV Prevalence

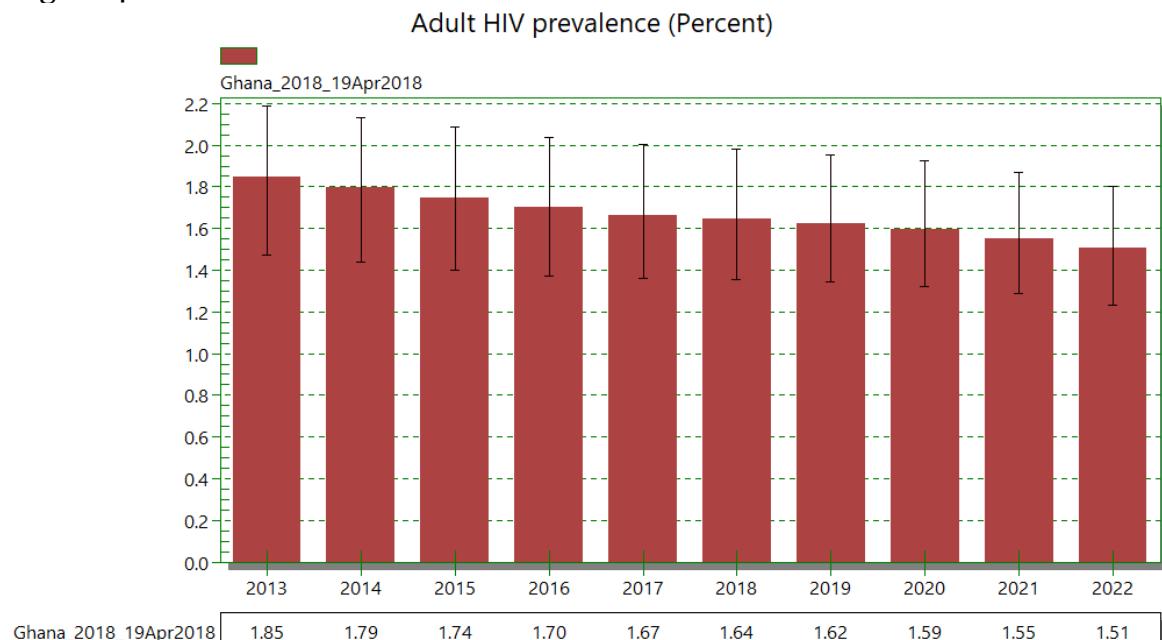

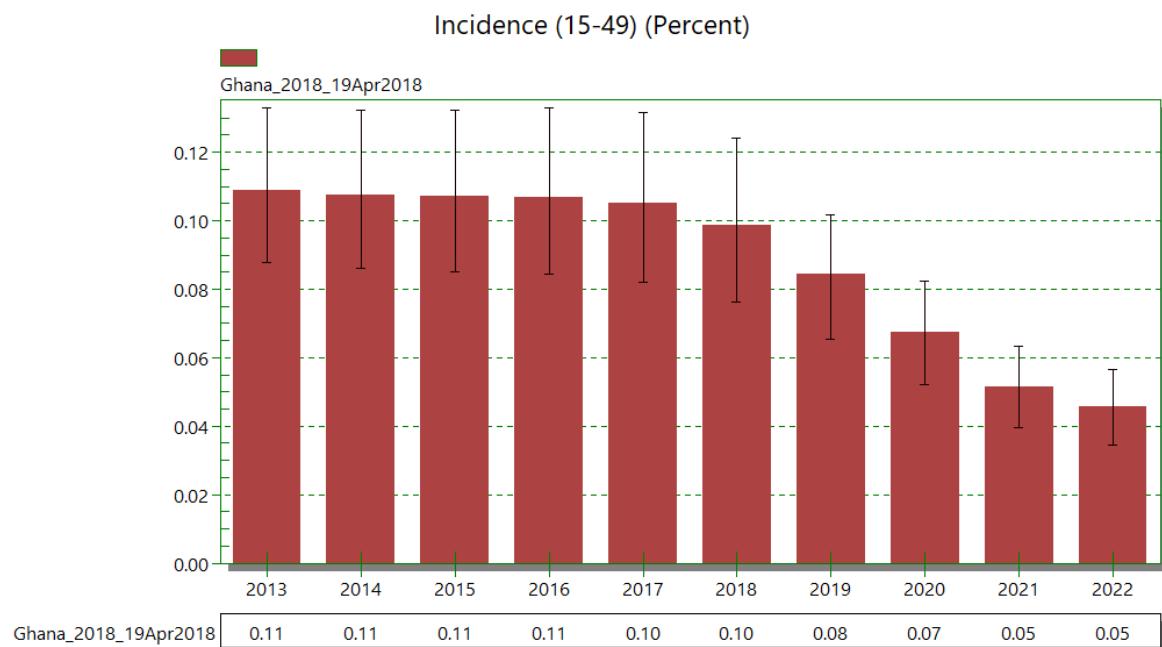

Figure 5: Adult Incidence

4.3.2 HIV Population

Overall HIV population is estimated to increase slowly from 309,918 in 2013 to 328,364 in 2022. This increase of 5.95% over the period is expected due to increased survival resulting from widespread use of ART over the last two decades.

Figure 6: Total HIV Population (Total)

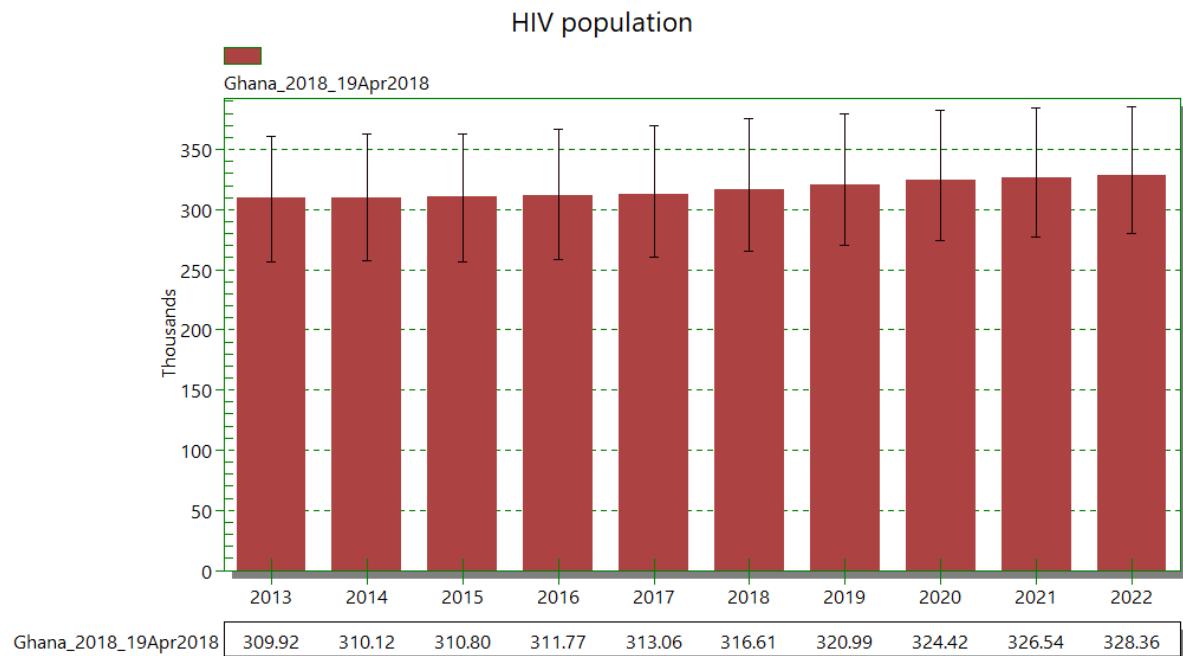

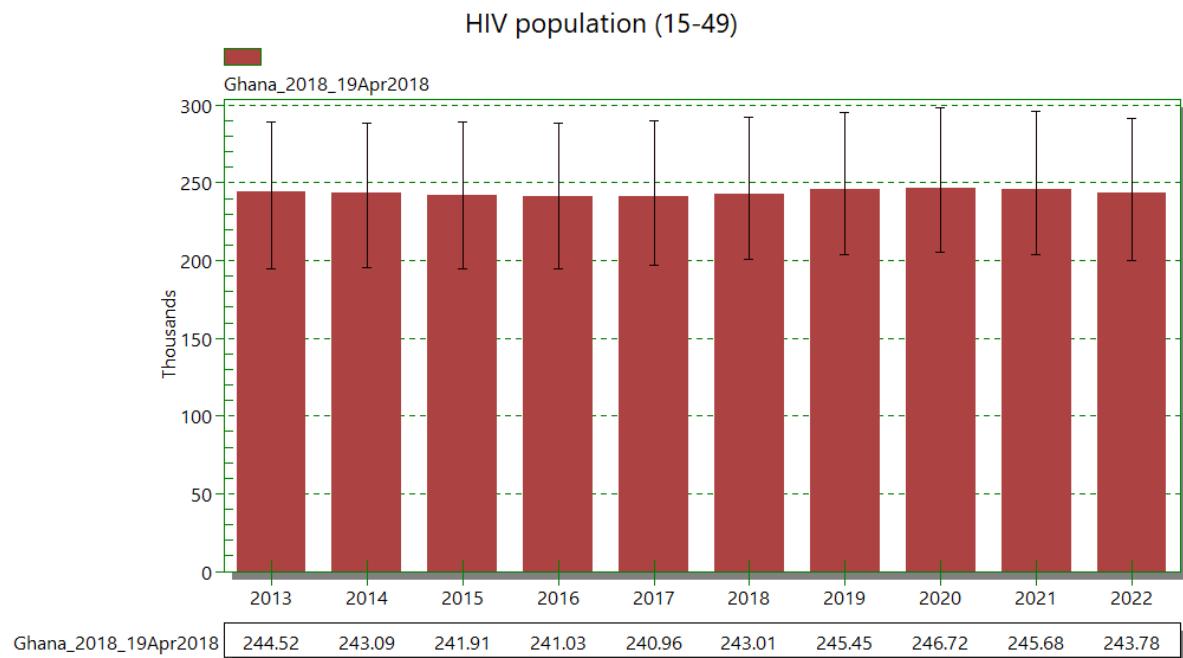

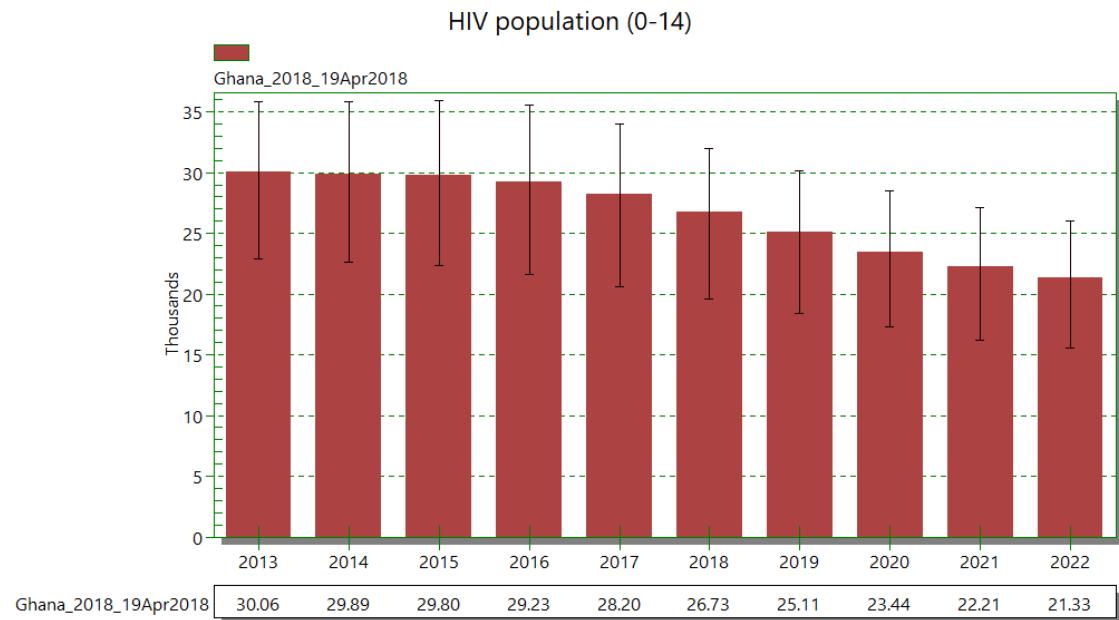

Figure 7: HIV Population (15-49) Years

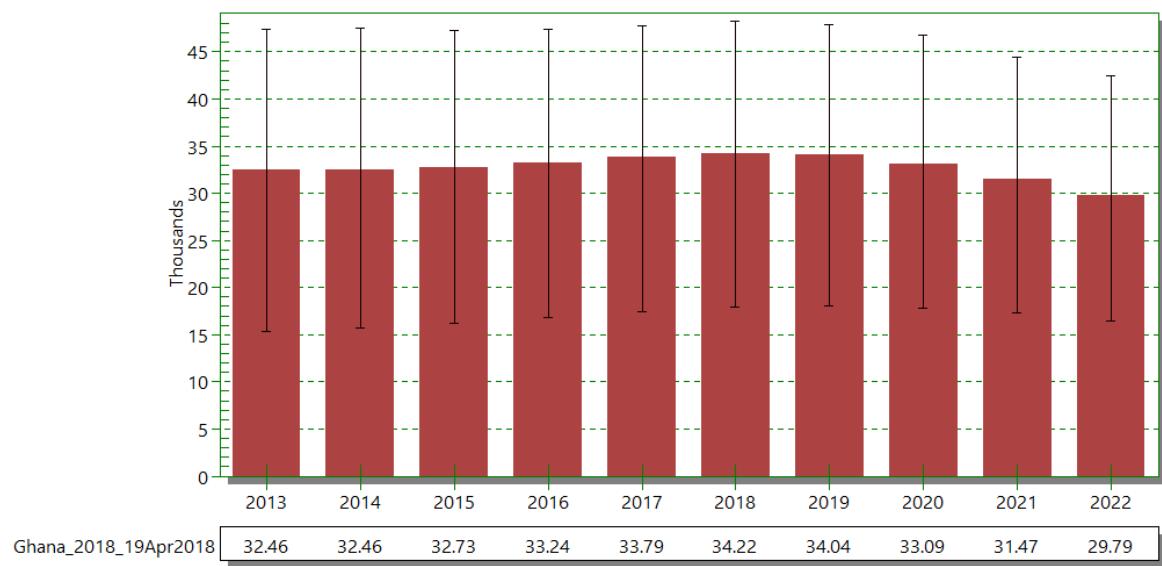

The HIV population among children 0 -14 years shows a decline from 30,061 in 2013 to 21,327 in 2022 (29.05% decline). This is due to expected reduction in new child infections through PMTCT. See figure 8.

Figure 8: HIV Population (0-14 Years)

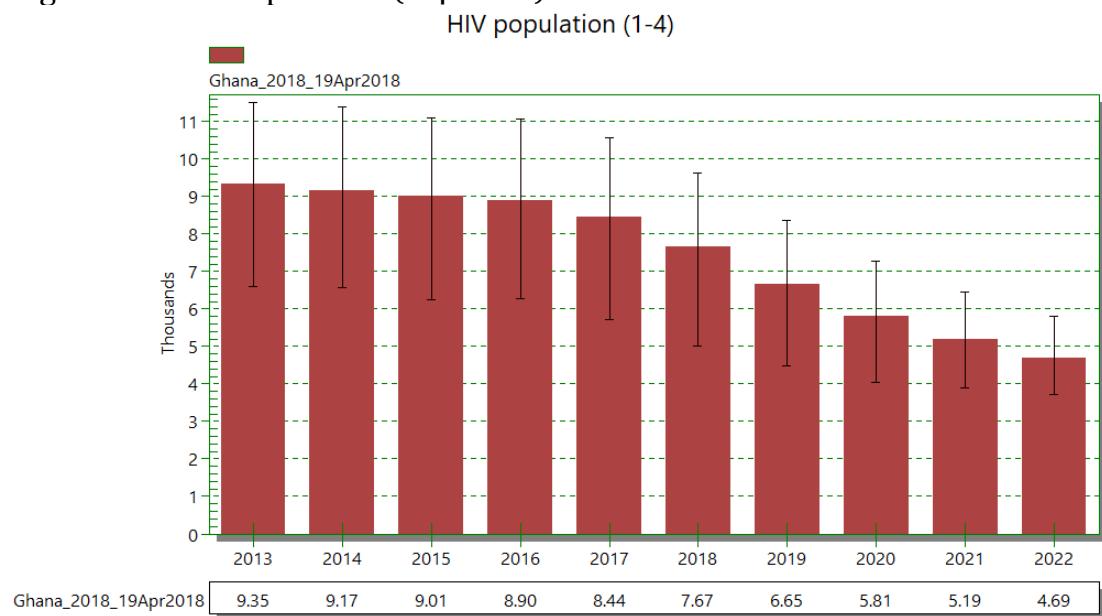

The HIV population among young adults 15-24 years increased between 2013 (32,462) to 2018 (34,219) representing a 5.41% increase. This increase can be partly due to reduction in public campaigns in HIV over the period as reported in the 2014 GDHS report. However, there is a projected decline from 34,219 in 2018 to 29,788 in 2022. This is partly attributed to new interventions which are expected to lead to a decline in new infections. The explanation for this trend is consistent with the findings of the projected new infections. See figure 9.

Figure 9: HIV Population (15-24 Years)

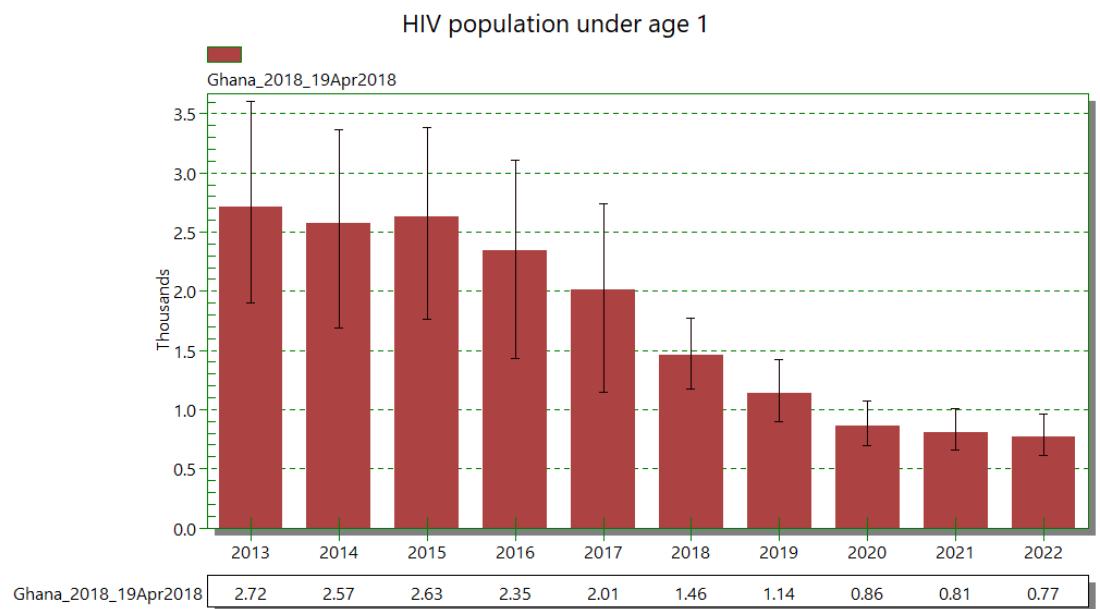

The HIV population among children 1 - 4 years shows a decline from 9,348 in 2013 to 4,689 in 2022 (49.84% decline). This is due to expected reduction in new child infections through PMTCT. See figure 10.

Figure 10: HIV Population (1-4 Years)

There is an estimated decline in the HIV population among children under age 1 from 2,715 in 2013 to 767 in 2022 (71.75% decline) due to expected reduction in new child infections through PMTCT. See figure 11

Figure 11: HIV Population less than one year

4.3.3 New HIV Infections

This section provides information on new HIV infections. Overall, New HIV infections are estimated to rise from 19,247 in 2013 to a peak of 19,568 in 2015 and eventually decline consistently to 9,275 in 2022.

New infections in the specified age group show a decline over the period 2013 to 2022. See Figures 12 - 16.

Figure 12: Number of New Infections (All)

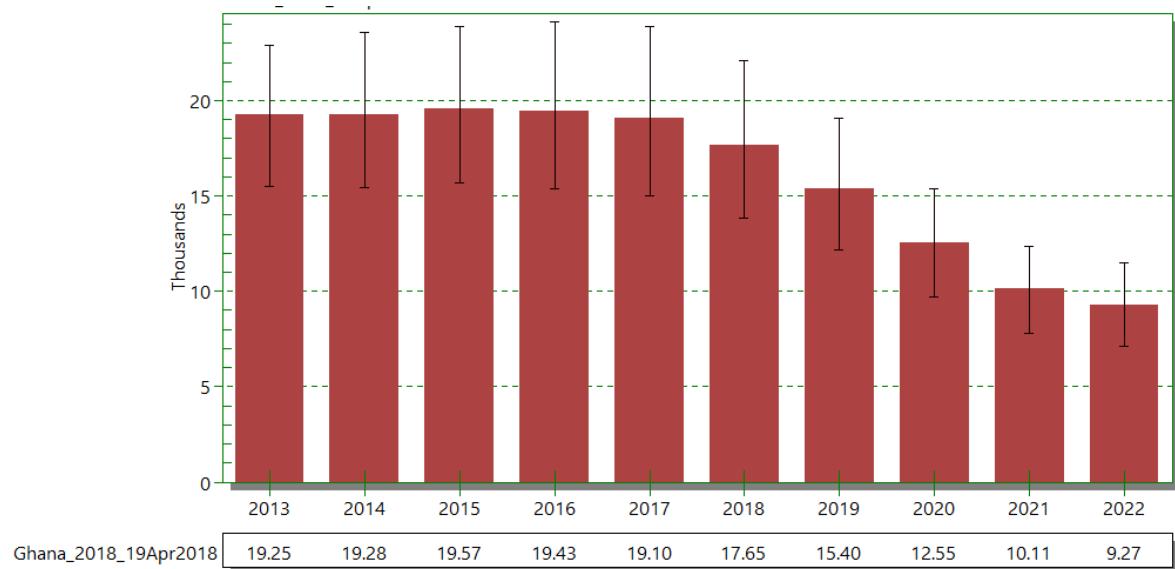

Figure 13: New HIV Infection (0-14 Years)

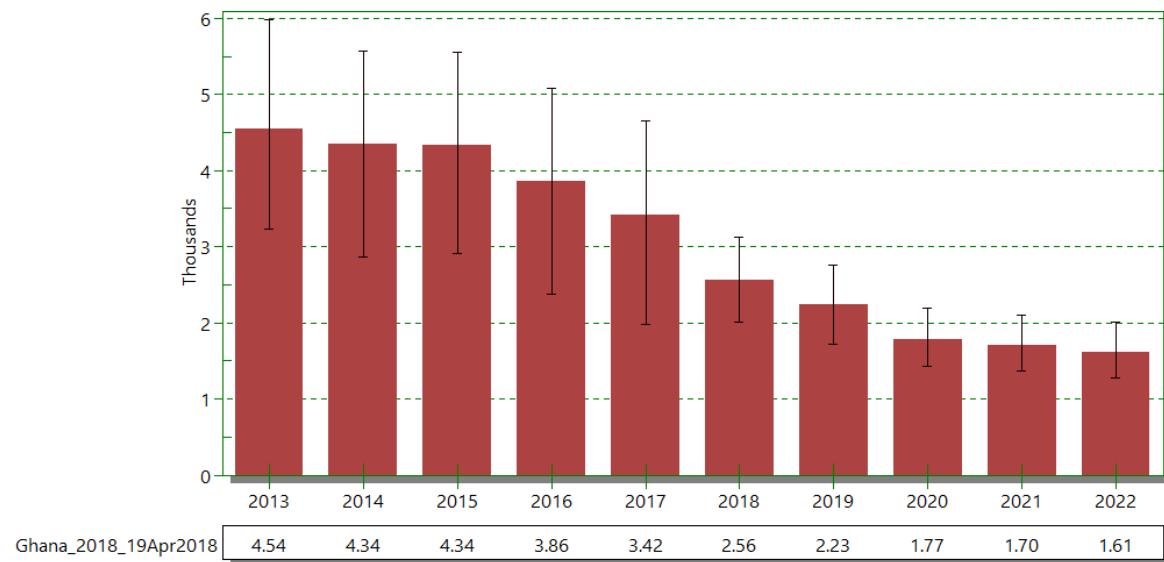

Figure 14: New HIV Infections (15-24 Years)

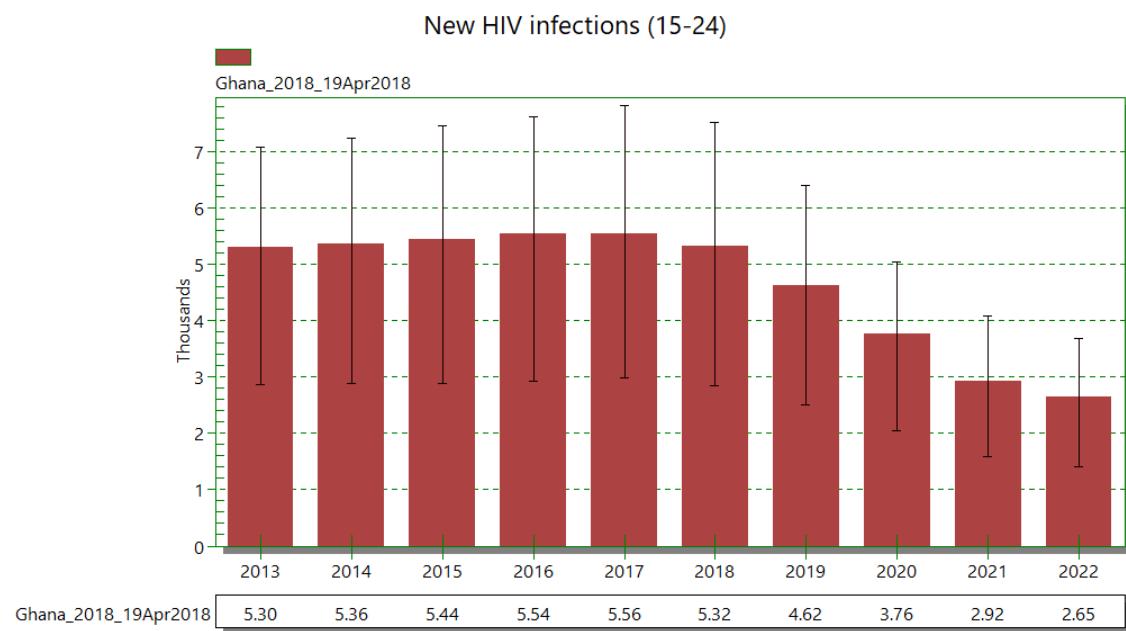

Figure 15 New HIV Infections (1-4 Years)

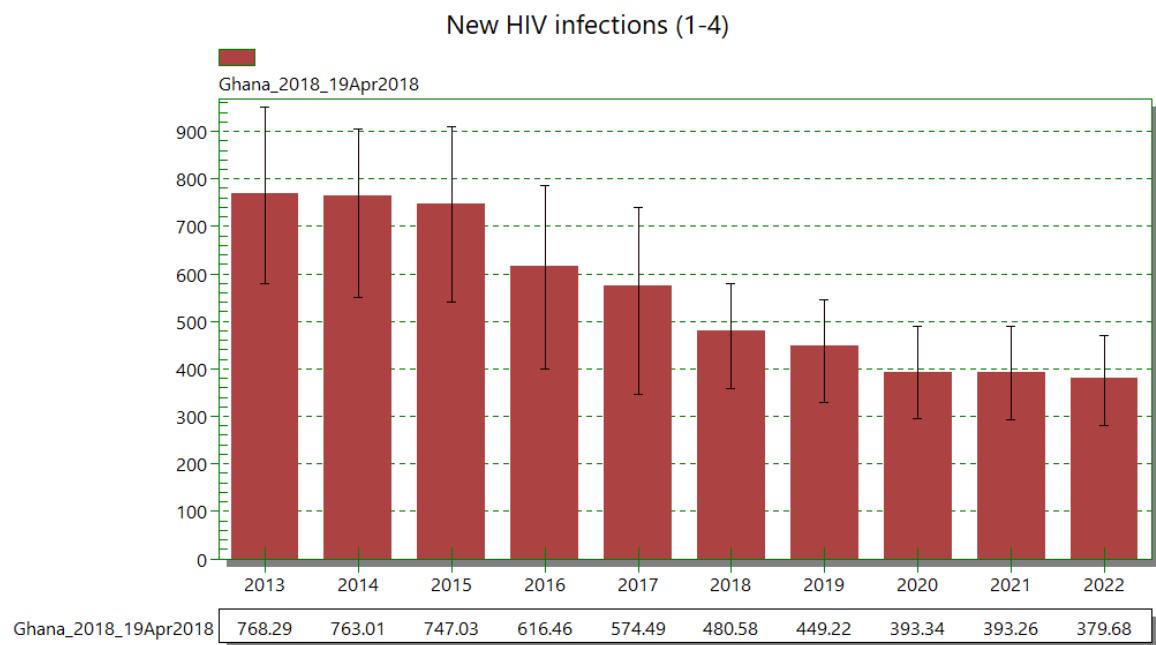

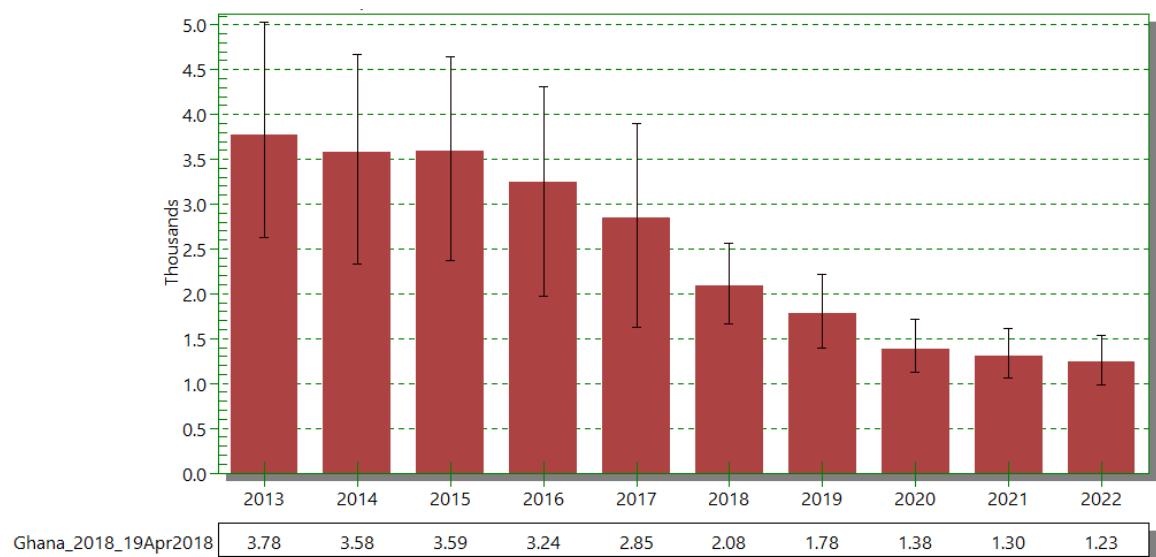

Figure 16: New Infant HIV Infections

4.4.4 Annual AIDS Deaths

Cumulative AIDS deaths for 2013 and 2022 are 381,920 and 486,683 respectively. Annual deaths are projected to decline from 16,891 in 2013 to 5,084 2022 (69.90% decline). This trend is replicated in all the age groups for the period. See figures 17, 18, 19 and 20 respectively.

Figure 17: Cumulative AIDS Deaths

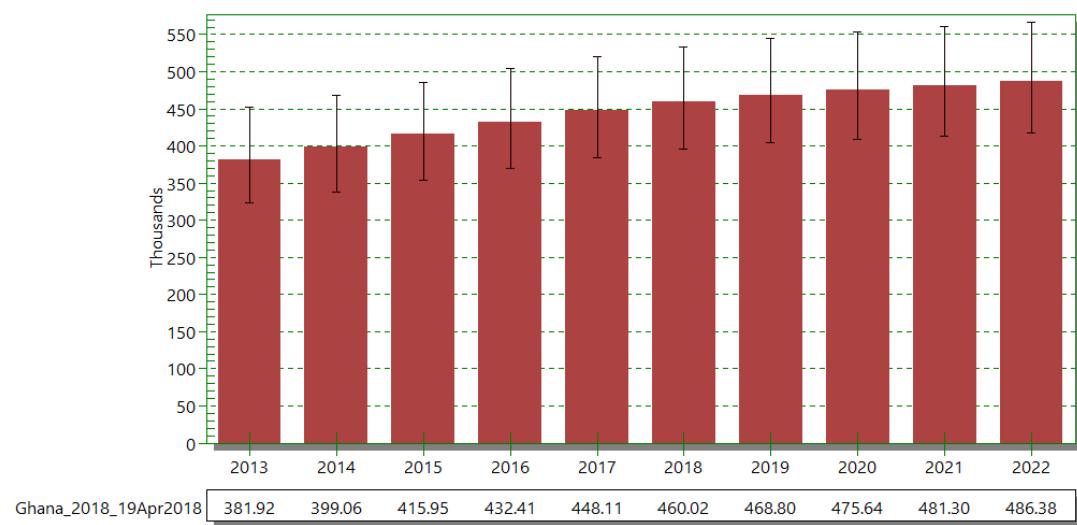

Figure 18: Annual AIDS Deaths (15-49 Years)

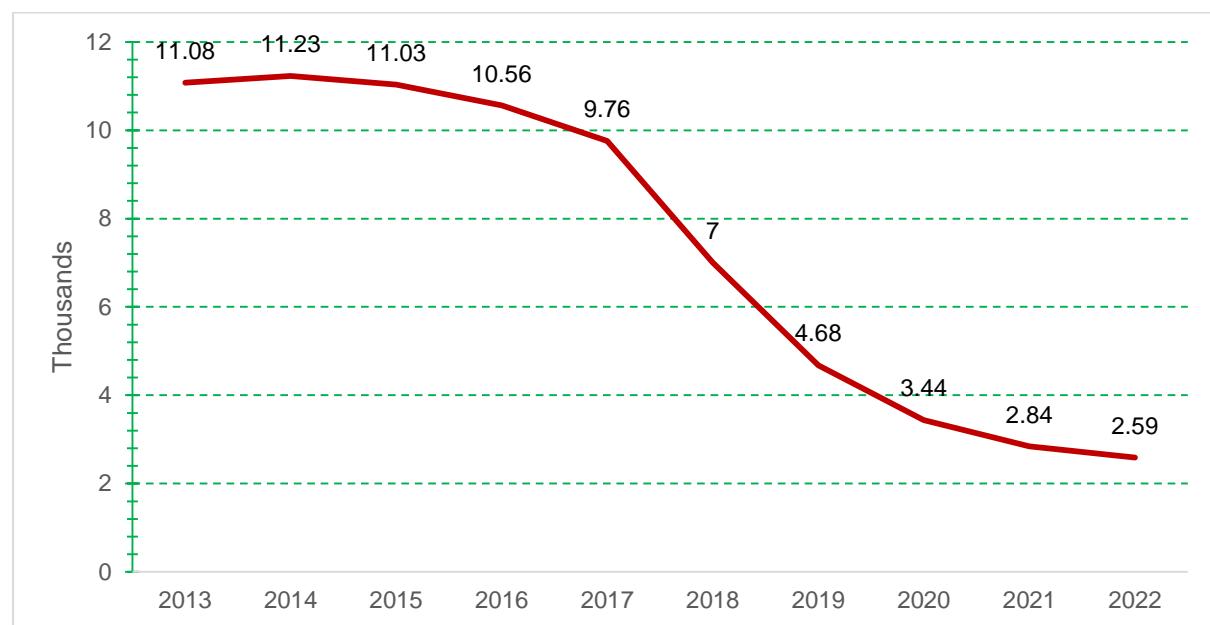

Figure 19: AIDS Deaths among Pregnant Women (15-49 Years)

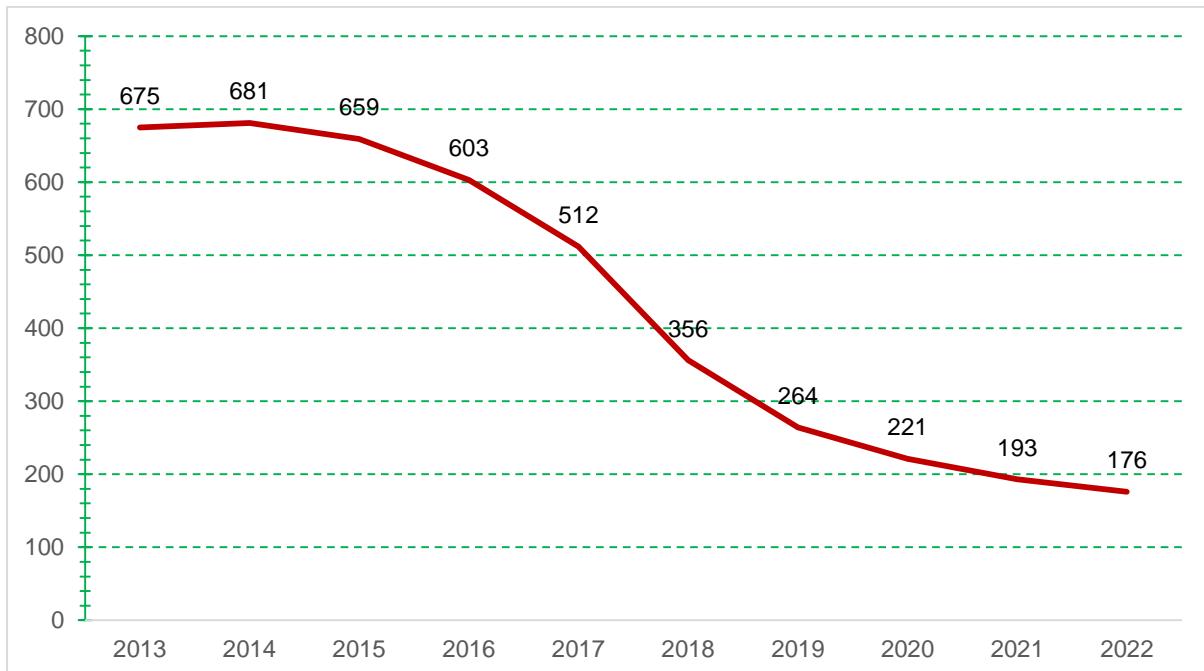

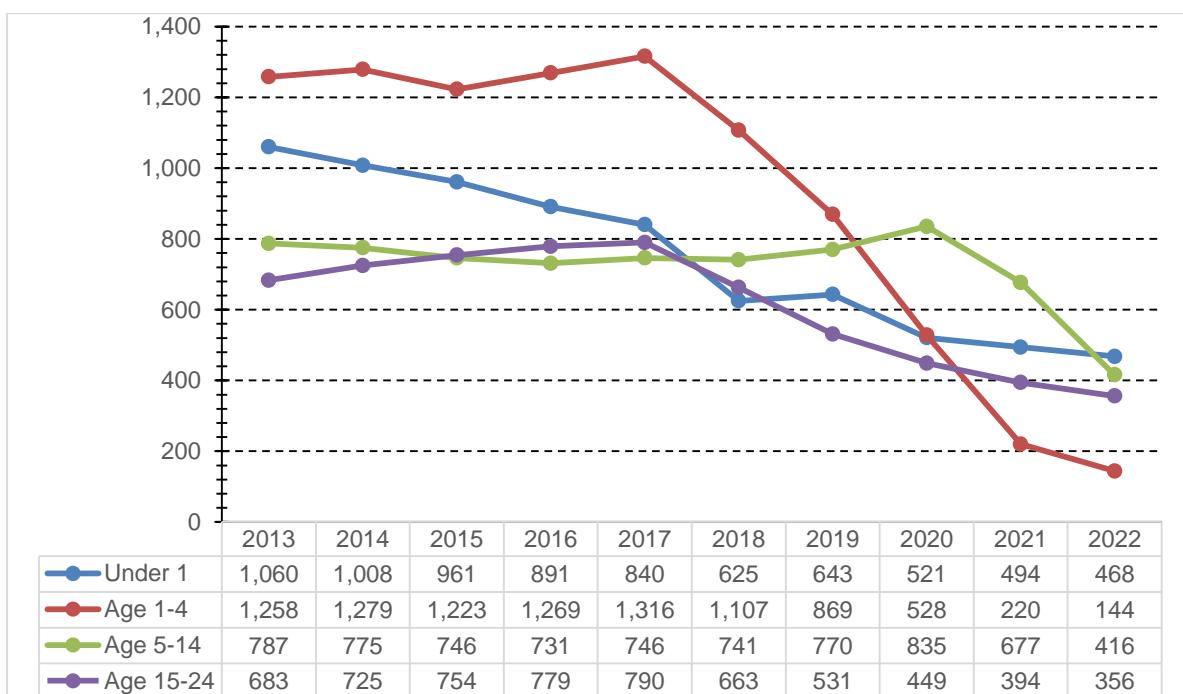

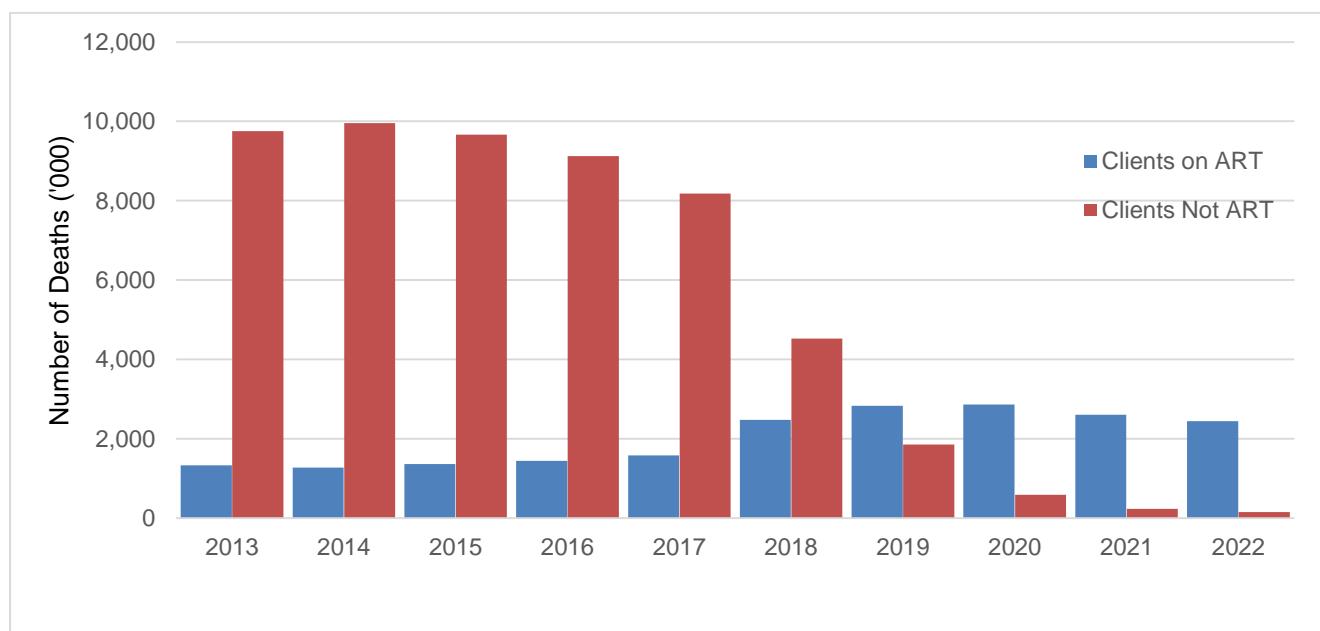

Figure 20: Annual AIDS Deaths in Children and Adolescents

Death is more likely to occur amongst clients who are not on ART than those on ART. This is shown clearly in Figure 21 where the projected annual number of deaths of clients on ART is relatively far lower than those not on ART for the period 2013 to 2018. From 2019 to 2022, the reverse is true: it is projected that deaths among clients not on ART will be fewer than those on ART. This could be due to the projected significant increase in ART coverage.

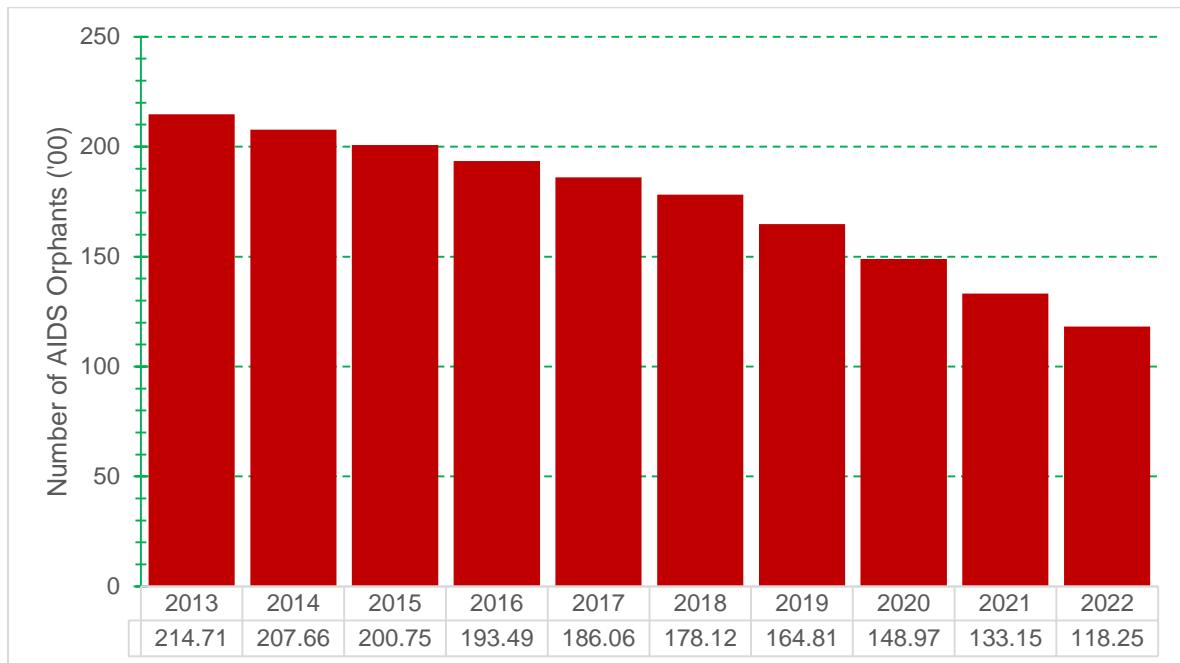

Figure 21: Annual AIDS Deaths for Clients on ART and Clients not on ART (15-49)

4.4.5 AIDS Orphans

Number of AIDS orphans is expected to decline from 214,804 in 2013 to 118,527 in 2022 due to the combined effects of ART and PMTCT as shown in Figure 22.

Figure 22: AIDS Orphans

4.4.6 ART Coverage

In 2016, Ghana has adopted the “Treat-All” policy which makes every PLHIV eligible for treatment and this is expected to increase PLHIV on ART. ART coverage of adults 15+ in 2016 is 33.88% and this is expected to hit 90.00% in 2020. This increase is expected to be seen across all age groups for the entire period. See figures 23, 24, 25 and 26.

Figure 23: ART Coverage of all HIV+ Adults (15 years and above)

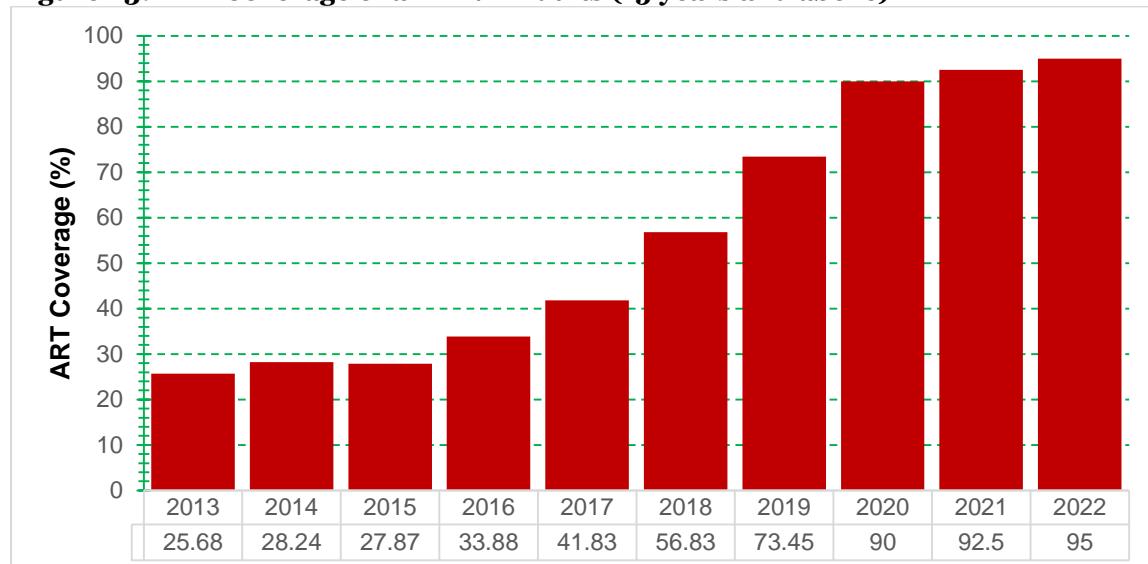

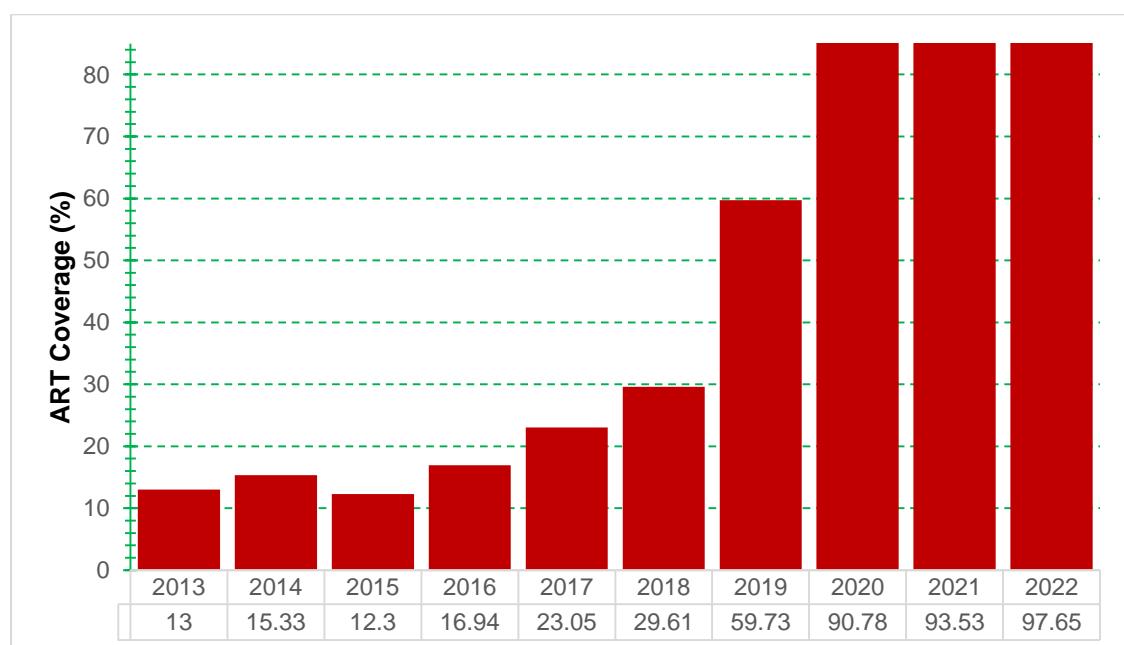

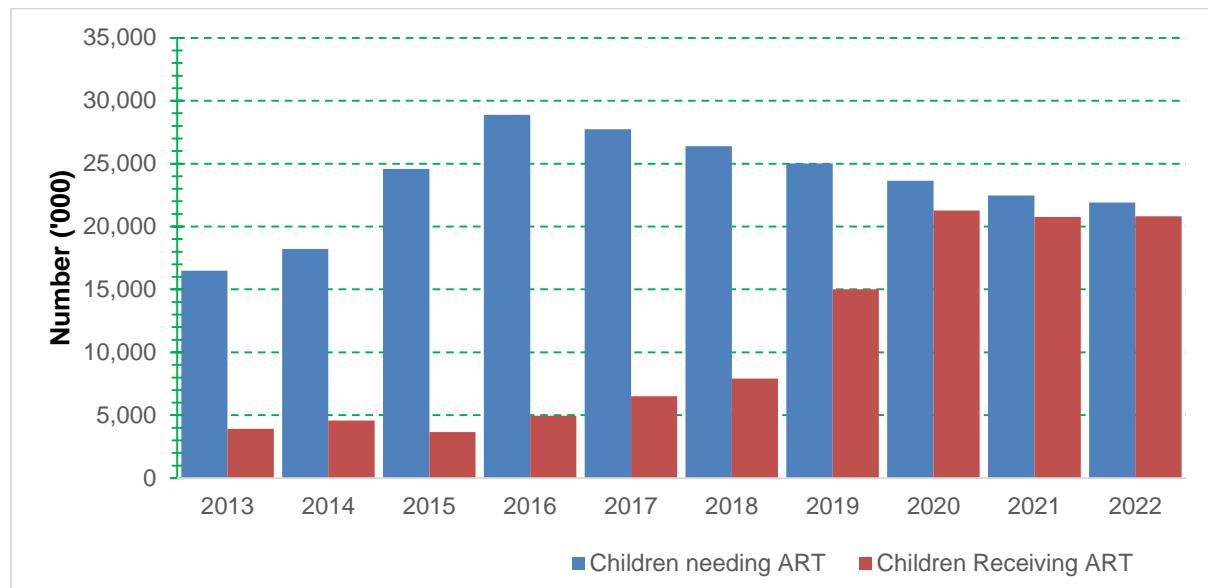

Figure 24: ART Coverage of All HIV+ Children (0-14)

4.4.7 ART and Co-trimoxazole

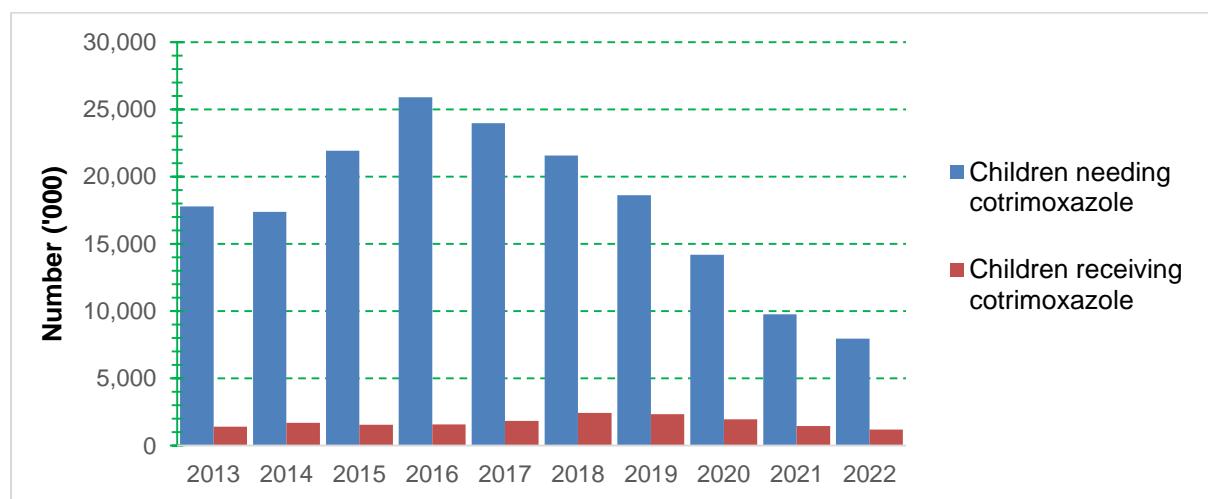

The number of children (0-14) needing ART is estimated to rise from 16,484 in 2013 to a peak of 28,872 and eventually decline to 21,921 in 2022. However, it is estimated that there will be a consistent rise in the children receiving ART from 3,907 in 2013 to 20,825 in 2022. Hence the unmet need is expected to shrink over time.

Figure 25: Children 0-14 Needing and Receiving ART

Even though there is a projected decline in the number of children needing cotrimoxazole, those receiving the treatment from the projection remains virtually unchanged and this is expected to result in high unmet need.

Figure 26: Children 0-14 years Needing and Receiving Cotrimoxazole

4.4.8 Prevention of Mother-to-Child Transmission of HIV

The unmet need for PMTCT is projected to reduce gradually so that there will be no unmet need from 2020 onward. This is because most mothers are projected to receive PMTCT services as displayed in figure 27.

Figure 27: Mothers Needing and Receiving PMTCT

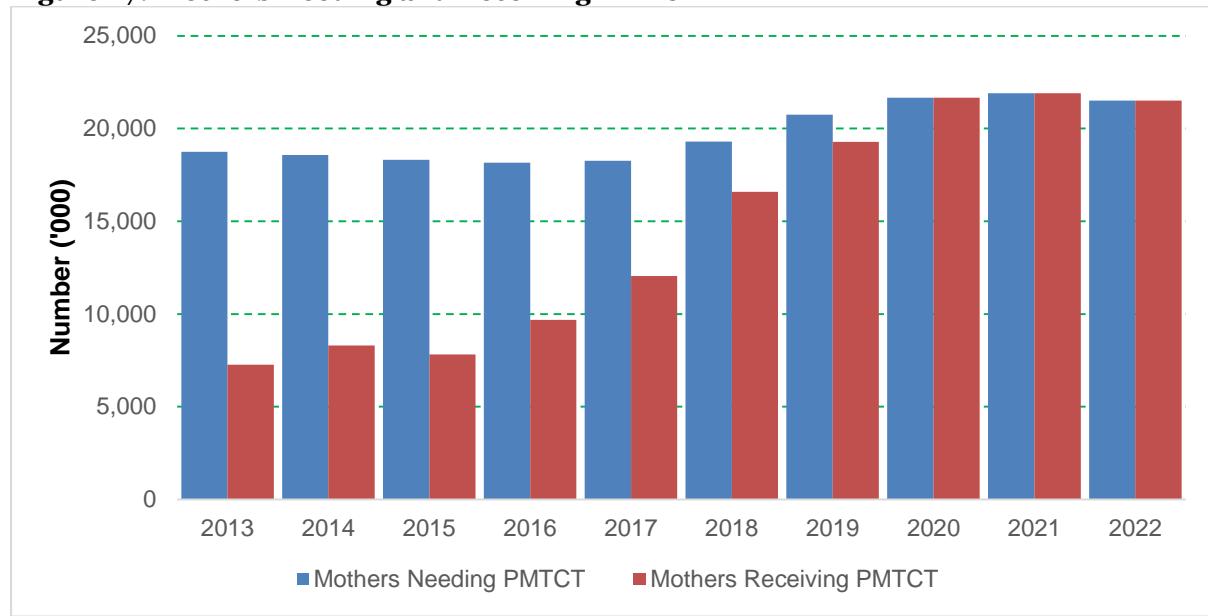

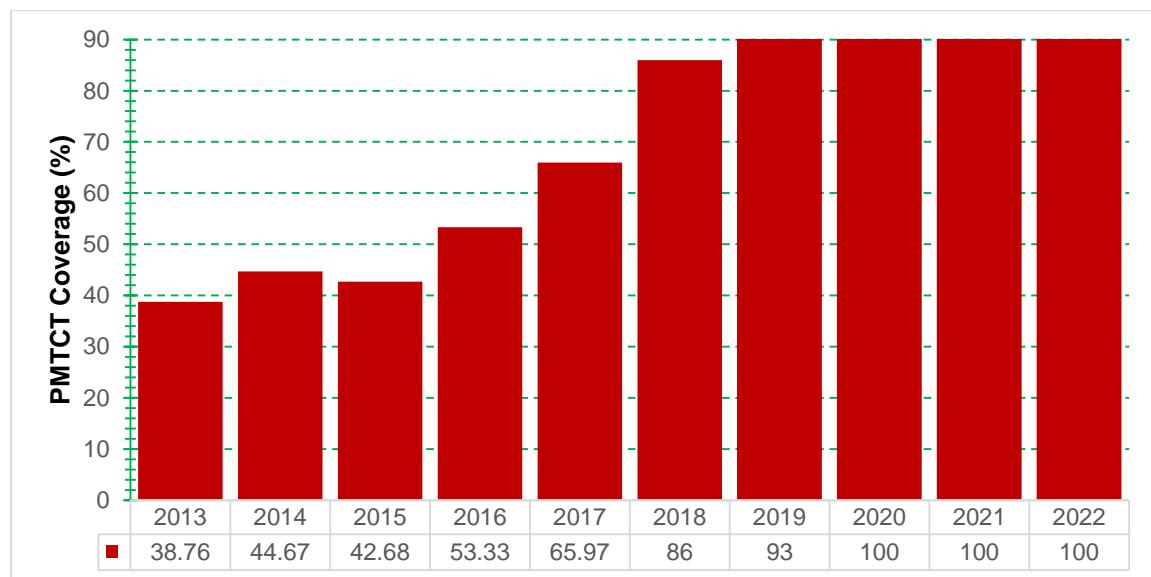

Figure 28 PMTCT Coverage

4.4.9 Impact of ART and PMTCT

Number of new infections due to mother-to-child transmission will decline gradually from 4,544 in 2013 to 1,614 in 2022, while deaths averted by ART are projected to increase from 7,730 in 2013 to 14,446 in 2022. See Figures 29 and 30.

Figure 29 Number of New Infections Due to Mother-to-Child Transmission

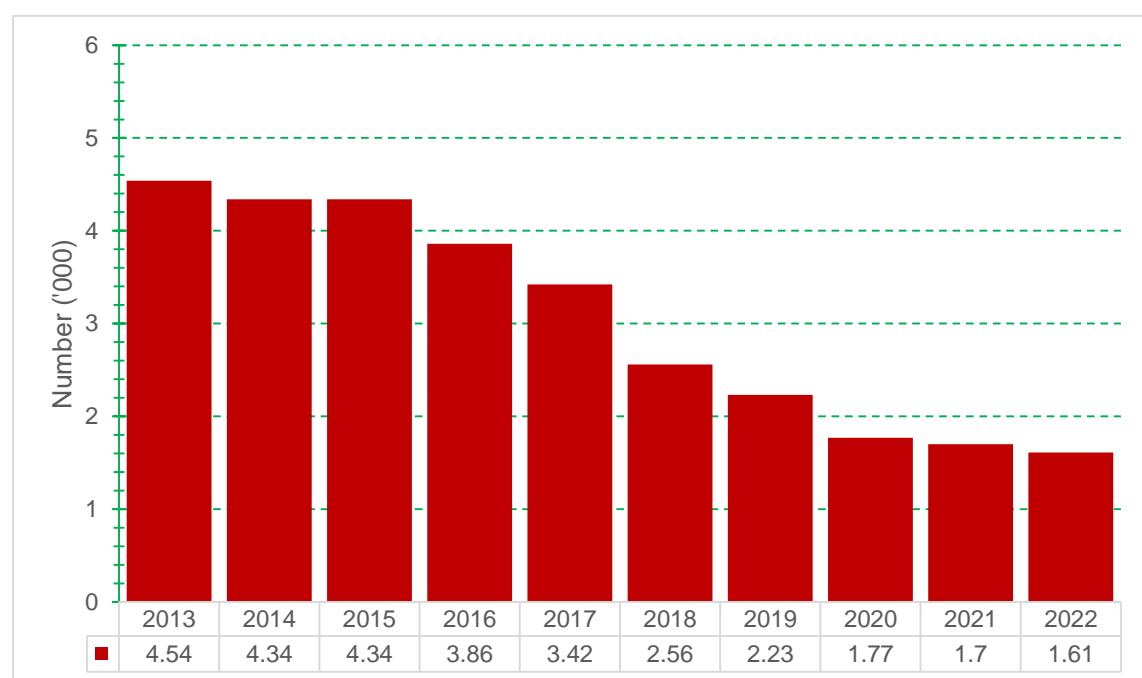

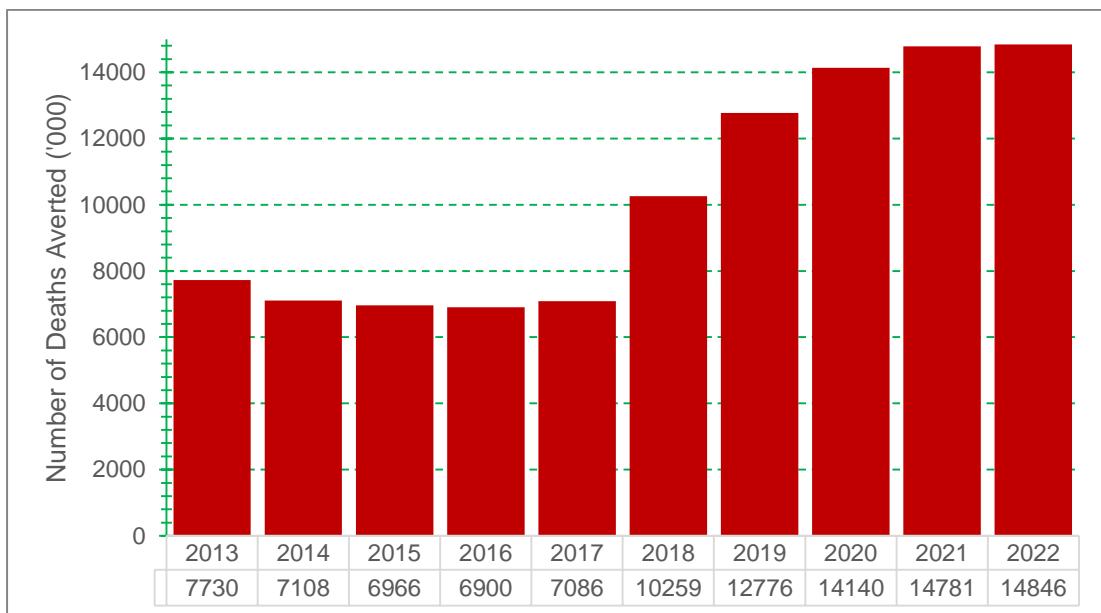

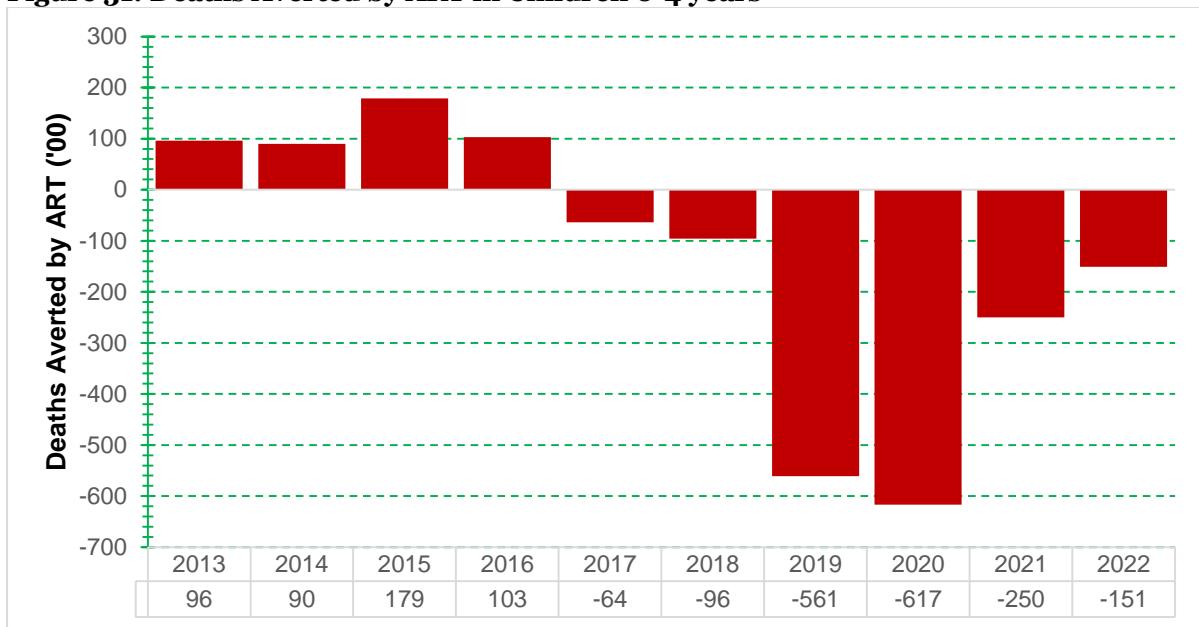

Figure 30: Deaths Averted by ART (ALL)

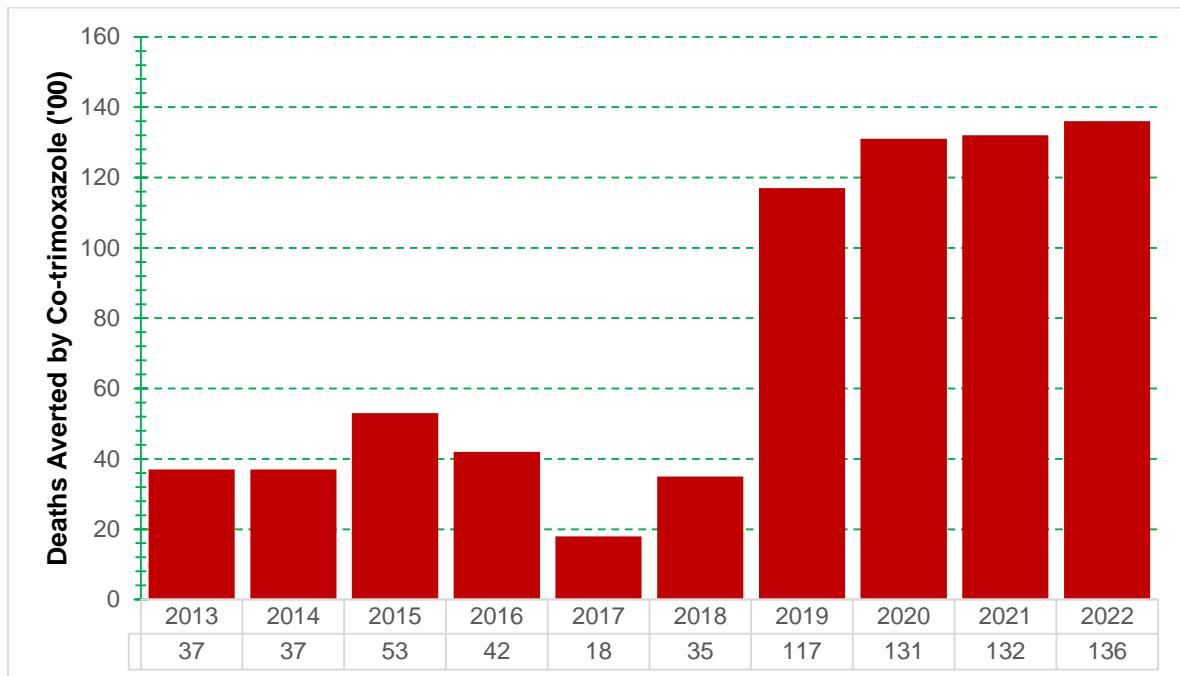

Deaths averted by ART in children are projected to increase from 37 in 2013 to 136 in 2022. The expected increment in death to be averted by ART and Co-trimoxazole post 2015 will largely be due to improved PMTCT and paediatric ART coverage and interventions following the implementation of new WHO recommendations.

Figure 31: Deaths Averted by ART in Children 0-4 years

Deaths averted by co-trimoxazole in children are projected to increase from 37 in 2013 to 136 in 2022. The expected increment in death to be averted by Co-trimoxazole post 2015 will largely be due to improved PMTCT and paediatric ART coverage and interventions following the implementation of new WHO recommendations.

Figure 32: Deaths Averted by Co-trimoxazole in Children 0-4 years

In general, there is an estimated increase in deaths averted by PMTCT in children (0-4 years) from 908 in 2013 to 2,531 in 2022 with a peak in 2020 (2,638). A similar trend is shown in new infections reaching its peak in 2021 (3,842).

Figure 33: Deaths averted by PMTCT in Children 0-4 Years

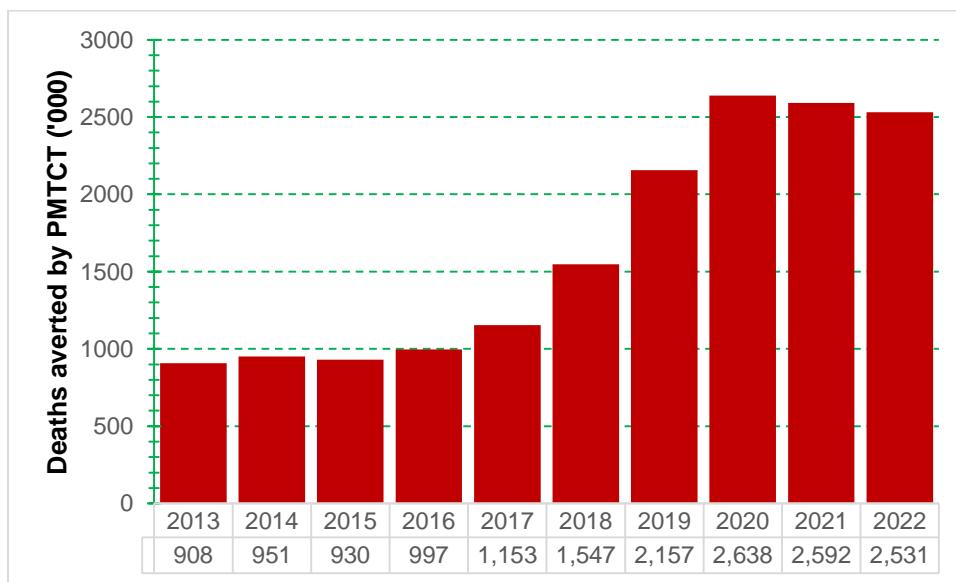

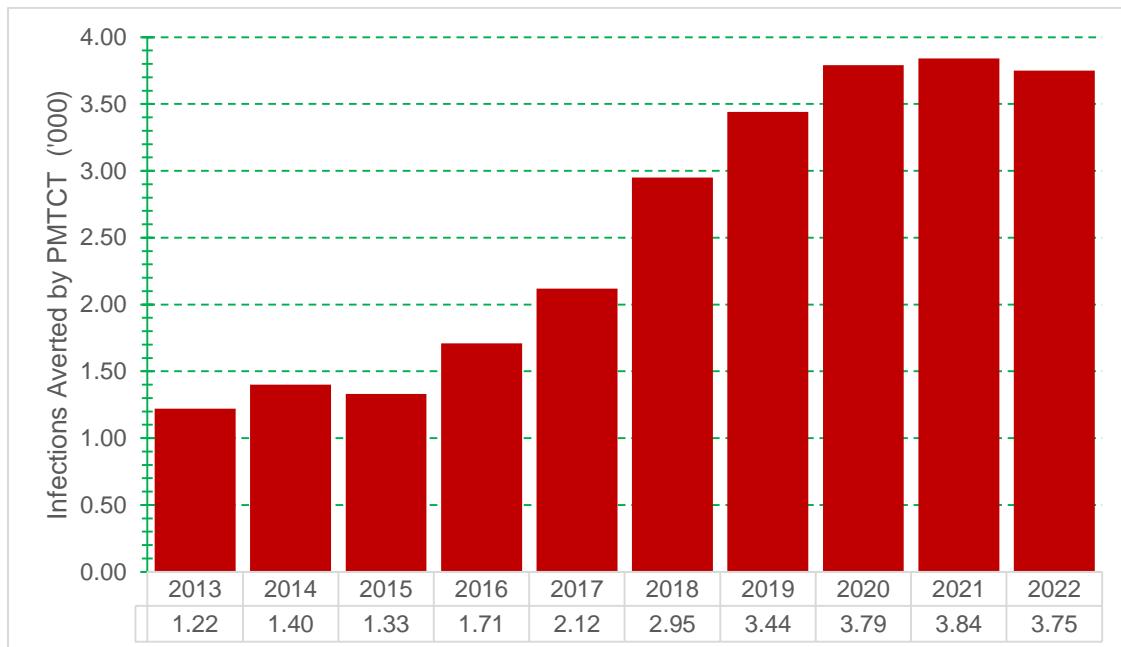

Figure 34: Infections Averted by PMTCT

As displayed in figure 41, Life-years gained due to ART and PMTCT is projected to increase progressively to 2022.

Figure 35: Life Years Gained by ART and PMTCT

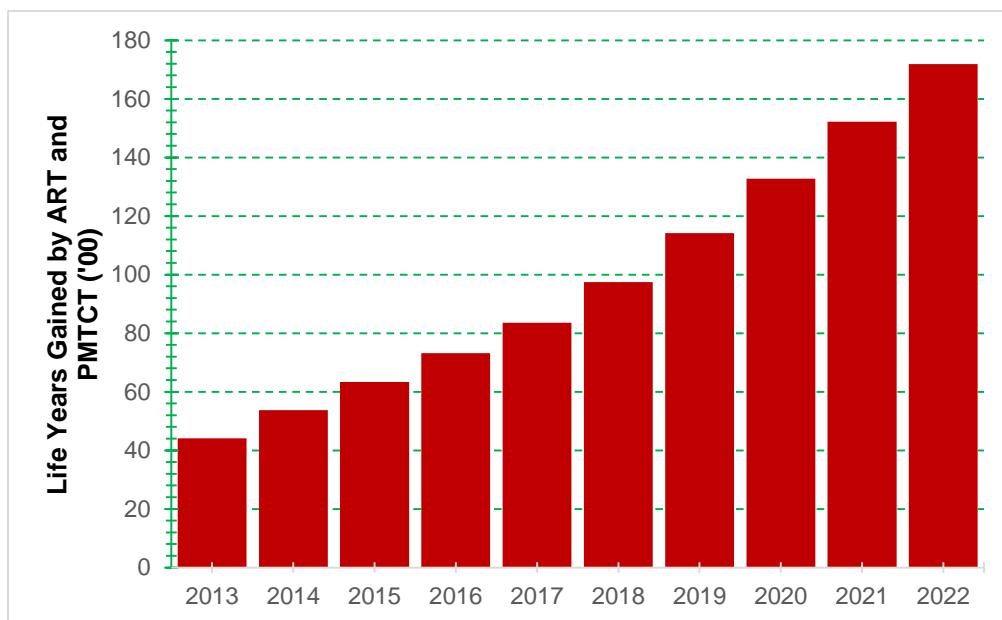

Table 7: Summary of HIV Population

HIV/AIDS summary		2017	2018	2019	2020	2021	2022
HIV population							
Total	313,063	316,613	320,992	324,417	326,540	328,364	
Male	109,163	108,506	108,823	109,309	109,582	109,825	
Female	203,900	208,108	212,169	215,108	216,958	218,539	
Prevalence (15-49)	1.67	1.64	1.62	1.59	1.55	1.51	
New HIV infections							
Total	19,101	17,649	15,400	12,553	10,112	9,275	
Male	7,126	6,491	5,670	4,618	3,770	3,471	
Female	11,975	11,158	9,731	7,935	6,342	5,803	
Annual AIDS deaths							
Total	15,694	11,908	8,780	6,840	5,663	5,084	
Male	7,698	6,168	4,361	3,126	2,476	2,185	
Female	7,996	5,740	4,419	3,714	3,188	2,899	

Approximately 65% of HIV population is female with a male to female ratio of 1: 1.9 as shown in Table 7 above. On the other hand, the proportion of females newly infected is averagely 63%. Furthermore, annual female deaths were higher than males (51%) in 2017.

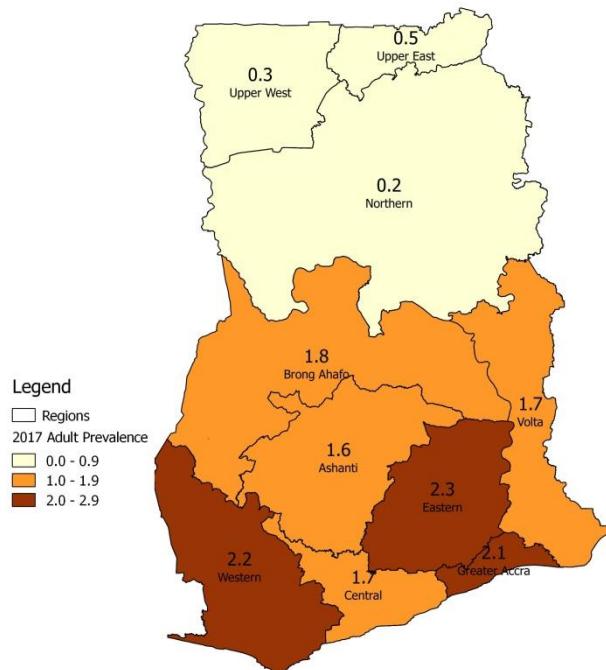

Table 8: Trends in Projected HIV Incidence, AIDS Mortality and ART Needs

	2017	2018	2019	2020	2021	2022
New HIV Infections	3,422	2,564	2,232	1,773	1,698	1,614

4.4 Sub-National Estimates Results

Figure 36 shows that the estimated adult (15 - 49 years) HIV prevalence at the Regional level ranges from a low of 0.2% in Northern Region to the highest of 2.3% in the Eastern Region. Western and Greater Accra recorded 2.2% and 2.1% respectively. Upper East and Upper West show a prevalence of less than 1%.

Figure 36. Map Showing Regional Adult (15 - 49 years) HIV prevalence

4.4.1 Regional HIV Prevalence for Age groups (0-14; 15-24 and 15+)

Among the age group 0–14, Greater Accra region has the highest prevalence of 0.5%. Western, Eastern, Brong Ahafo, and Ashanti regions accounted for the second highest prevalence of 0.3% each whilst Northern Region has the lowest prevalence of 0.03%.

Eastern, Greater Accra and Western Regions have the highest HIV prevalence for the age group 15–24 years with 0.8% each. For the age group 15 years and older, Western Region recorded the highest HIV prevalence of 2.2% with the lowest being Northern Region recording 0.2%. See Table 9.

Table 9: Regional HIV Prevalence for Age groups: 0-14; 15-24 and 15+

Region	Prevalence among Age Group (years)		
	0-14	15-24	15+
Ashanti	0.3%	0.6%	1.5%
Brong Ahafo	0.3%	0.6%	1.8%
Central	0.2%	0.6%	1.6%
Eastern	0.3%	0.8%	2.1%
Greater Accra	0.5%	0.8%	2.1%
Northern	0.03%	0.1%	0.2%
Upper East	0.1%	0.2%	0.4%
Upper West	0.04%	0.1%	0.3%
Volta	0.2%	0.6%	1.6%
Western	0.3%	0.8%	2.2%

Detailed prevalence for all the Districts is shown in Table 37 to Table 40 in the annex.

4.4.2 Regional Distribution of HIV Population

The regional distribution of HIV population is as shown in Table 10 below. Greater Accra with the highest population of 73,556 constituting 23.5%. Upper West has the lowest number of people living with HIV constituting 0.5%.

Table 10. Regional Distribution of HIV population, 2017

Region	Male	Female	Total	
			Number	Percent
Ashanti	20,219	37,765	57,984	18.5
Brong Ahafo	10,951	20,455	31,406	10
Central	9,246	17,271	26,518	8.5
Eastern	15,491	28,935	44,425	14.2
Greater Accra	25,648	47,907	73,556	23.5
Northern	1,495	2,792	4,287	1.4
Upper East	1,215	2,269	3,484	1.1
Upper West	551	1,029	1,581	0.5
Volta	9,211	17,205	26,416	8.4
Western	15,136	28,271	43,406	13.9
Total	109,163	203,900	313,063	100.0

4.4.3 Age Distribution of HIV Population by Region

Table 11 below shows the age distribution of HIV population by Region. For the year group, 15 years and older, Greater Accra and Ashanti Regions have the highest number of people living with HIV whilst Upper East and Upper West have the lowest.

Greater Accra and Ashanti Regions have the highest number of people living with HIV for the 15-24 year group whilst Upper East and Upper West have the lowest.

Among the year group 15-49, the HIV population follows the same trend as the year groups described above: Ashanti and Greater Accra Regions recorded the highest whilst Upper West and Northern Regions have the lowest.

Table 11. Distribution of HIV Population by region and age group

Region	HIV Population among Age Group (years)			
	0-14	15-24	15 - 49	15+
Ashanti	5,224	6,259	44,630	52,760
Brong Ahafo	2,829	3,390	24,174	28,577
Central	2,389	2,862	20,410	24,129
Eastern	4,002	4,795	34,194	40,423
Greater Accra	6,626	7,940	56,616	66,930
Northern	386	463	3,300	3,901
Upper East	314	376	2,682	3,170
Upper West	142	171	1,216	1,438
Volta	2,380	2,851	20,332	24,036
Western	3,910	4,685	33,410	39,496
Total	28,202	33,792	240,964	284,860

4.4.4 Regional Distribution of New HIV Infections by Age

Greater Accra and Ashanti Regions recorded the highest new HIV infections whilst Upper West has the least. Table 12 show detailed regional distribution of new HIV infections by the various age groups.

Table 12 Regional Distribution of New HIV Infections by Age

Region	Male	Female	Total	
			Number	Percent
Ashanti	1,320	2,218	3538	18.5
Brong Ahafo	715	1201	1916	10
Central	604	1014	1618	8.5
Eastern	1,011	1699	2711	14.2
Greater Accra	1674	2814	4488	23.5
Northern	98	164	262	1.4
Upper East	79	133	213	1.1
Upper West	36	60	96	0.5
Volta	601	1011	1612	8.4
Western	988	1660	2648	13.9
Total	7126	11976	19101	100.0

4.4.5 Annual AIDS Deaths

Table 13 below show the Regional distribution of annual AIDS death. The highest number of AIDS deaths is recorded in the Greater Accra Region (11.7%) with the lowest occurring in Upper West (0.3%).

Table 13. Annual AIDS Deaths

Region	Male	Female	Total	
			Number	Percent
Ashanti	1,426	1,481	2,907	9.3
Brong Ahafo	772	802	1,574	5
Central	652	677	1,329	4.2
Eastern	1,092	1,135	2,227	7.1
Greater Accra	1,809	1,879	3,687	11.7
Northern	105	109	215	0.7
Upper East	86	89	175	0.6
Upper West	39	40	79	0.3
Volta	650	675	1,324	4.2
Western	1,067	1,109	2,176	6.9
Total	7,698	7,996	15,694	100.0

4.5 District level estimates

This section provides information on HIV indicators such as Prevalence, HIV Population, New Infections and Annual AIDS deaths by using excel allocation method for all the 216 districts.

The prevalence among the Districts ranges from low rate of 0.00% in Karaga District to as high as 5.64% in Lower Manya Krobo Municipal. Tables 15, 16 and 17 below show the prevalence in the Districts for the prevalence less than 1.00%, from 1.00% to less than 2.00% and greater than 2.00% respectively.

It is critical to note that Districts in Table 14 that have prevalence of more than 2.00% calls for the urgent need to scale up focused interventions in order to stem the tide.

Table 14. Districts with Prevalence 2.00% and above

No	District	HIV Prevalence	No	District	HIV Prevalence

5.0 CONCLUSION

The 2017 - 2022 estimates results projects HIV prevalence to reduce from 1.67% to 1.51%. Also, new infections and AIDS-related deaths are projected to decrease within the same period due to increased uptake of ART services. This reduction in new infection and AIDS deaths is expected to lead the country in achieving epidemic control. The results in this report will further help epidemiologist, researchers and other key stakeholders to accelerate efforts towards achieving 90-90-90 and ending AIDS by 2030.
